

L^AT_EX support for Fedra Serif Pro

Michael Ummels

v0,5 – 2011/08/29

Abstract

This document describes the fedraserif package, which provides L^AT_EX support for the commercial Fedra Serif Pro fonts in both text and math mode.

1 Overview

The fedraserif package provides L^AT_EX support for the commercial Fedra[®] Serif Pro fonts¹ from Typotheque². You can load this package by adding

```
\usepackage[options]{fedraserif}
```

to the preamble of your document. If no options are specified, this will change both the text font and the math font to Fedra Serif A; use the option `variant=B` to select Fedra Serif B. For the available options, see Section 3.

Acknowledgements

This package is heavily influenced by the MinionPro package, developed by Achim Blumensath, Andreas Böhmann and Michael Zedler, as well as the lucimatx package by Walter Schmidt. Additionally, I am indebted to Eddie Kohler for creating the LCDf typetools.

2 Interferences with other packages

In order to use Fedra Serif as a math font, you need to have the fdsymbol package (version 0.7 or higher) installed. Apart from fdsymbol, the fedraserif package automatically loads the packages textcomp and amsmath. Additionally, the fontaxes

<code>variant</code>	A*, B	4.1

package, which is bundled with the MinionPro package, is loaded if it is present in your L^AT_EX installation. If you want to pass options to these packages, you can either load these packages beforehand, or you can include the options in the `\documentclass` command. Unless the option `nomath` is used, the `fedraserif` package is *not* compatible with `amssymb` and `amsfonts` (since `fdsymbol` is not).

3 Options

All package options are set using a `\key=value` syntax. Boolean options accept true and false as values, and setting a Boolean key without a value is equivalent to setting it to true. Table 1 lists all option keys of the `fedraserif` package with their possible values; values that are marked with an asterisk correspond to the default behaviour of the package.

4 Font selection

4.1 Variants

Fedra Serif Pro comes in two variants: *Fedra Serif A* has a lower contrast and shorter ascenders, which makes it a good choice for small sizes, whereas *Fedra Serif B* has an increased contrast and longer ascenders. To select one variant, use the `variant` key: setting `variant=A` will select Fedra Serif A (the default), while `variant=B` will select Fedra Serif B. Additionally, setting `variant=auto` will select Fedra Serif A for text in normal and small sizes and Fedra Serif B for text in large sizes (larger than 12pt).

4.2 Encodings

The package currently supports the OT1, T1, LY1, QX and T5 encodings for typesetting text with Latin characters, as well as the TS1 encoding for typesetting text symbols. For typesetting text with accented characters, it is strongly recommended to change the default font encoding from OT1 to T1 or one of the other encodings. This can be achieved by putting `\usepackage[T1]{fontenc}` in the preamble of your document.

4.3 Weights

All fonts of the Fedra Serif Pro family come in four weights, which are (in increasing order) Book, Demi, Medium and Bold. Of these, Book and Demi can be used as the standard text font, while Medium and Bold can be used for bold text. The option keys `normalweight` and `boldweight` allow to control which weights are used for the standard L^AT_EX font series `m` and `b` (or `bx`), selected by `\mdseries` and `\bfseries`, respectively. For example, to use the Demi weight as the standard text font, use the option `normalweight=Demi`. By default, only the Book and the Medium weights are used. Additionally, both keys can be set to the value `auto`, which selects a weight depending on the font size (Book and Medium for normal and large sizes, Demi and Bold for small sizes). Independently of these options, the Demi and the Bold weight can always be accessed using the commands `\fontseries{md}` and `\fontseries{ub}`, respectively.

4.4 Shapes

In addition to the normal small caps shapes `sc` and `scit`, there are letterspaced versions `ssc` and `sscit`. Moreover, italic shapes with *swash capitals* are accessible via the `sw`, `scsw` and `sscs` shapes (see Table 2).

If the `fontaxes` package is available, you can use the commands `\sscshape` and `\textssc{<text>}` to switch to letterspaced small caps and the commands `\swshape` and `\textsw{<text>}` to switch to swash capitals.

4.5 Figures

Fedra Serif Pro offers four main figure versions (see 3). On the one hand, one can choose between *lining figures* and *text figures*, also known as *old-style figures*. On the other hand, one can choose between *proportional figures* and *tabular figures*.

By default, proportional lining figures are used throughout the document. If you want to use text figures instead, use the option `figures=text` or `figures=osf`.

Assuming that the `fontaxes` package is installed on your system, you can use the command `\figureversion` to switch between different figure versions inside

Table 2: Summary of font shapes

Shape	Example
n	A Quick Brown Fox Jumps Over The Lazy Dog.
it	<i>A Quick Brown Fox Jumps Over The Lazy Dog.</i>
sc	A QUICK BROWN FOX JUMPS OVER THE LAZY DOG.
ssc	A QUICK BROWN FOX JUMPS OVER THE LAZY DOG.
scit	<i>A QUICK BROWN FOX JUMPS OVER THE LAZY DOG.</i>
sscit	<i>A QUICK BROWN FOX JUMPS OVER THE LAZY DOG.</i>
sw	<i>A Quick Brown Fox Jumps Over The Lazy Dog.</i>
scsw	<i>A QUICK BROWN FOX JUMPS OVER THE LAZY DOG.</i>
sscs	<i>A QUICK BROWN FOX JUMPS OVER THE LAZY DOG.</i>

Table 3: Summary of figure versions

	Lining figures	Text figures
Proportional	0123456789	o123456789
Tabular	0123456789	o123456789

the document. Possible arguments are `text` or `osf` for text figures, `lining` or `lf` for lining figures, `tabular` or `tab` for tabular figures, and `proportional` or `prop` for proportional figures. Note that you can combine several arguments. For example, the command `\figureversion{osf, tabular}` selects tabular text figures.

Small and slanted fractions are fractions with a height matching the font’s body size; they can be accessed via:

`\smallfrac{⟨numerator⟩}{⟨denominator⟩}` $\frac{3}{17}$
`\slantfrac{⟨numerator⟩}{⟨denominator⟩}` $\frac{3}{17}$

Note that only figures can be used for `⟨numerator⟩` and `⟨denominator⟩`.

Finally, Fedra Serif Pro offers so-called bullet figures, which are enclosed by a circle; they can be accessed via:

`\openbullet{⟨number⟩}` ① ②③④
`\closedbullet{⟨number⟩}` ⑤ ⑥⑦⑧

As for small and slanted fractions, only figures can be used for `⟨number⟩`.

4.6 Footnotes

By setting the option `footnotemarks`, footnote marks are set using special characters designed for this purpose, i.e. ^{1,a} instead of ^{1,a}. However, this only works for footnote marks that consist of figures and the lowercase letters a–z.

4.7 Dingbats

Assuming that the pifont package is loaded, you can access Fedra Serif’s ornamental characters via:

```
\Pisymbol{FedraSerifPro-Pi}{\number}
```

The available glyphs are listed in Table 4.

4.8 Additional notes

Fedra Serif Pro implements a large subset of the glyphs made available by the TS1 encoding. However, the following glyphs are missing:

<code>\textdblhyphen</code>	<code>\textdivorced</code>	<code>\textdied</code>
<code>\textleaf</code>	<code>\textmarried</code>	<code>\textmusicalnote</code>
<code>\textdblhyphenchar</code>	<code>\textdollaroldstyle</code>	<code>\textcentoldstyle</code>
<code>\textguarani</code>	<code>\textpertenthousand</code>	<code>\textpilcrow</code>
<code>\textbaht</code>	<code>\textdiscount</code>	<code>\textlquill</code>
<code>\textrquill</code>	<code>\textcopyleft</code>	<code>\textreferencemark</code>

In addition to the monetary symbols defined by the TS1 encoding, the following currency symbols are available:

₧	<code>\textcruzeiro</code>	₣	<code>\textfranc</code>	₧	<code>\textmill</code>
₪	<code>\textpeseta</code>	₧	<code>\textrupee</code>	₪	<code>\textsheqel</code>
₧	<code>\textkip</code>	₧	<code>\texttugrik</code>	₪	<code>\texthryvnia</code>

5 Math support

By default, we change the math font to Fedra Serif Pro with mathematical symbols taken from FdSymbol. To disable this behaviour, use the option `nomath`. Note that all other options described in this section have no effect if this option is active.

5.1 Letters

In $\text{T}_{\text{E}}\text{X}$ and $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$, uppercase Greek letters are traditionally set upright in math mode, even when they are used as variables. This differs from the ISO standards ISO31-0:1992 to ISO31-13:1992, which mandate italics in this case. While the package employs the $\text{T}_{\text{E}}\text{X}$ tradition by default, you can select the ISO behaviour by setting the option `math-style=iso`. Independently of this option, you can always select upright and italic greek letters using the commands `\upalpha`, `\italpha`, `\upGamma`, `\itGamma`, etc. Additionally, the `math-style` key can take the value `french`, in which case all Greek and uppercase roman letters are typeset upright.

tex	$a, b, \dots, A, B, \dots, \alpha, \beta, \dots, \Gamma, \Delta, \dots$
iso	$a, b, \dots, A, B, \dots, \alpha, \beta, \dots, \Gamma, \Delta, \dots$
french	$a, b, \dots, A, B, \dots, \alpha, \beta, \dots, \Gamma, \Delta, \dots$

For an illustration of the differences between the three values for `math-style`, see Table 5.

The `fedraserif` package provides all letters available in math mode with the Computer Modern fonts, with the exception of `\varpi` and `\varrho`, which have the same shape as `\pi` and `\rho`, respectively. Additionally, the following letters and letter-like symbols are can be typeset:

β	<code>\varbeta</code> ³	κ	<code>\varkappa</code> ³	\digamma	<code>\digamma</code> ³
ε	<code>\backepsilon</code> ³	ε	<code>\varbackepsilon</code> ³	\hslash	<code>\hslash</code>
λ	<code>\lambdabar</code>	λ	<code>\lambdaslash</code>	\eth	<code>\eth</code> ³

\hbar	<code>\uphbar</code>	\beth	<code>\beth</code>	λ	<code>\gimel</code>
\daleth	<code>\daleth</code>				

5.2 Digits

By default, digits in math mode are typeset in the default figure version for text mode (as selected by the `figures` key). To use lining figures in math mode even if `figures=text` is active, set the option `stdmathdigits`.

Apart from the standard math versions `normal` and `bold`, the package introduces two new math versions `tabular` and `boldtabular`, in which digits are typeset as tabular figures.

5.3 Blackboard characters

Fedra Serif Pro has a limited set of blackboard characters, namely \mathbb{N} , \mathbb{Z} , \mathbb{Q} , \mathbb{R} , \mathbb{C} , \mathbb{k} and \mathbb{l} . To use these characters for the math blackboard alphabet `\mathbb{b}`, set the option `fedrabb`. If this option is not selected, the AMS blackboard bold font is used instead, which has the advantage that all uppercase roman letters are available.

³The shape of the symbol is different if the option `math-style=french` is selected. Upright and italic shapes are also available directly via the commands `\up{cmd}` and `\it{cmd}`, respectively.

7 Implementation

7.1 Options

We use xkeyval’s key mechanism to declare all options.

```

1 \package
2 \RequirePackage{xkeyval}
3 \newcommand*\fdrsf@boolkey[2]{%
4   \define@boolkey{fedraserif.sty}[fdrsf@]{#1}[true]{#2}%

Font selection

The package `fedraserif-fd` adapts the font definitions to the requested font set (see Section 9). So we simply pass on the relevant options. Additional care has to be taken to pass the right options to `fdsymbol`.

7.3 Math font setup

We use `FdSymbol` for most mathematical symbols.

```

Some math symbols are taken from the text font by `fdsymbol`. Use the correct math figure version for these.

9 Font definition support package

As all font definitions look the same, we introduce macros to ease the configuration. These macros are stored in the file `fedraserif-fd.sty`, which is included by every FD file. Since `fedraserif-fd.sty` will be included several times and we do not know in which context the code is executed, we have to define all non-private commands as globals and avoid all `\preambleonly` commands.

We add a guard so that this file is executed only once even if it is included multiple times.

```

571 <*fontdef>
572 \ifx\fdrsf@variant@normal\@undefined\else\endinput\fi

```

We distinguish between being loaded directly or via `\usepackage` in the preamble by checking `\@nodocument`.

```

573 \ifx\@nodocument\relax\else
574 \NeedsTeXFormat{LaTeX2e}
575 \RequirePackage{xkeyval}
576 \fi

```

Reset `\escapechar` (which is set to `-1` in FD files) to make `\newcommand` work. The additional group does not harm; we have to make the important commands global anyway.

```

577 \ifx\@nodocument\relax
578 \begingroup
579 \escapechar'\
580 \fi

```

The macro to make commands global is taken from the `otfontdef` package.

```

581 \newcommand*\fdrsf@makeglobal[1]{%
582 \global\expandafter\let\csname #1\expandafter\endcsname
583 \csname #1\endcsname
584 }

```

9.1 Options

These are the default values if it is impossible to process options.

```
585 \newcommand\fdrsf@variant@normal{A}
586 \newcommand\fdrsf@variant@large{A}
587 \newcommand\fdrsf@mweight@normal{Book}

9.2 Font configuration

We define commands to write to and read from the configuration database.

```

642 \newcommand*{\fdrsf@addconfig}[4][\%
643 \@for\@tempa:=#3\do{\%
644 \expandafter
645 \gdef\csname fdrsf@config@#2@#1\@tempa\endcsname{#4}%
646 }%
647 }
648 \newcommand*{\fdrsf@useconfig}[3]{\%
649 \@ifundefined{fdrsf@config@#2@#1@#3}{\%
650 \@ifundefined{fdrsf@config@#2@#3}{\%
651 {\csname fdrsf@config@#2@#3\endcsname}%
652 }{\csname fdrsf@config@#2@#1@#3\endcsname}%
653 }
654 \fdrsf@makeglobal{\fdrsf@useconfig}

```

Now we can build up the configuration database.

```

655 \fdrsf@addconfig{weight/normal}{m}{\fdrsf@mweight@normal}
656 \fdrsf@addconfig{weight/small}{m}{\fdrsf@mweight@small}
657 \fdrsf@addconfig{weight/normal}{md}{Demi}

662 \fdrsf@addconfig{weight/normal}{ub}{Bold}
663 \fdrsf@addconfig{subs/series}{sb,bx}{b}
664 \fdrsf@addconfig{italic}{it,scit,sscit,sw,scsw,sscs}{Italic}

```

```

673 \fdrsf@addconfig{subs/shape}{scsl}{scit}
